SUMMARY

Software engineer focused on AI infrastructure and agent systems. Built a local-first memory engine for AI assistants combining graph and vector storage, an enterprise AI agent integrated with SAP systems, and a native desktop AI agent with screen understanding. Comfortable working across the stack — from Rust systems code to LLM integration to product UI.

SKILLS

Primary: Python, Rust, TypeScript, Retrieval-Augmented Generation (RAG), Model Context Protocol (MCP)

Secondary: Vector Databases (Qdrant), Graph Databases (SurrealDB), LLM APIs (OpenAI, Anthropic, Gemini)

Additional: Go, Swift, Kotlin, SQL

Tools: Docker, Git, PostgreSQL, Supabase

EXPERIENCE

Cinntra Infotech

2026 – Present

Systems Engineer

- Built CIRA, a Retrieval-Augmented Generation (RAG) agent that translates natural-language requests into audited SAP HANA queries and write operations, giving non-technical users direct access to enterprise data.
- Built the backend for a point-of-sale system, including transaction recording, merchant reconciliation, and offline synchronization.

Niswa Engg

2024 – 2026

Technical Consultant & Automation Engineer

- Built asynchronous AI agents in TypeScript that automated over 80% of a content generation and scheduling pipeline.
- Built the company website in Astro, reaching a 95+ Google Lighthouse performance score.
- Set up cloud infrastructure, API integrations, and event-driven automation workflows.

Sudarshana Foundation

Contractual / Freelance

Full-Stack & Automation Engineer

- Designed and built the organization's first centralized web platform.
- Built database systems handling 5,000+ monthly transactions.
- Digitized paper-based workflows into software infrastructure.

PROJECTS

Cortex — local-first memory layer for AI assistants (Rust, SurrealDB, Qdrant)

github.com/Aryan-Protein-Vala/CORTEX

- Built a hybrid graph- and vector-based memory engine so multiple AI tools (Claude, ChatGPT, Cursor) share the same long-term memory instead of starting from zero each session.
- Implemented a decay algorithm, based on the Ebbinghaus forgetting curve, so relevant information persists while unused information fades automatically.
- Built a Model Context Protocol (MCP) server, desktop app, browser extension, and Python client for the engine.

MyloOS — ambient AI desktop agent (Rust, Tauri, Next.js)

github.com/Aryan-Protein-Vala/MyloOS

- Built a native desktop AI agent that overlays contextual guidance directly on top of active applications using Windows Graphics Capture.
- Built Rust plugins for global hotkeys, screen capture, and input injection, with a bring-your-own-key model supporting Gemini, OpenAI, and Claude APIs.
- Designed for local-only processing — no screenshots saved to disk or uploaded to a server.

DermaOS — AI product-recommendation platform (Next.js, TypeScript, Prisma)

github.com/Aryan-Protein-Vala/DermaOS

- Built a Retrieval-Augmented Generation (RAG) engine that matches products to user metrics extracted from AI-analyzed photos.
- Built authentication, payments, and report export end-to-end; deployed to production on Vercel.
